Waterfall

Agile

Agile

Agile is an iterative approach to project management and software development that helps teams deliver value to their customers faster and with fewer headaches. Instead of betting everything on a “big bang” launch, an agile team delivers work in small, but consumable, increments.

Small & frequent releases

Agile Manifesto

On February 11-13, 2001, at The Lodge at Snowbird ski resort in the Wasatch mountains of Utah, seventeen people met to talk, ski, relax, and try to find common ground – and of course, to eat. What emerged was the Agile “Software Development” Manifesto.

As to gather such a group organizational anarchists (persons who believes that government and laws are not necessary) would be hard, so what emerged from this meeting was symbolic –a Manifesto for Agile Software development –signed by all the participants.

The term Agile is coined by Martin Fowler. They named themselves “**The Agile Alliance**” this group of independent thinkers about software development, and sometimes competitors to each other.

Fundamental Values of Agile Software Development

Those 17 thinkers agreed on a set of values
that defined a culture.

Principles behind the Agile Manifesto

Agile Manifesto in short

- Customer Satisfaction
- Welcome changing requirements
- Deliver working software frequently
- Business and Devs works together daily
- Build project around motivated individuals
- Face-to-face conversations
- Working Software = Progress measure
- Promotes sustainable development
- Continuous attention to technical excellence and good design enhances agility
- Simplicity is essential
- The best emerge from self-organizing teams
- Regularly reflect on becoming more productive, then tune and adjust behaviour accordingly

The Agile Group Model

How an Agile team works

Agile breaks goals down into several independent products that can be developed, released, and iterated upon quickly instead of a traditional project management, which is directed towards major final deliverable.

Two main styles of Agile project management are **Scrum** and **Kanban**, which both utilize a board to visualize tasks in columns of to-do, in progress, and done.

Few Defining characteristics of an Agile workflow:

- **Daily standup** – A daily meeting to discuss what work was done yesterday, what they're working on today, and any questions that come up in b/w **contributors and managers**.
- **Sprints** – Short spans in which products are planned, developed, reviewed, and released. They are projects within the projects.
- **Regular reviews and retrospective** – An Agile team manages itself, but there are built-in measures to make sure work is being delivered at a consistent quality. **Peer reviews and reviews by managers** occur before tasks get completed and after the sprint is over.

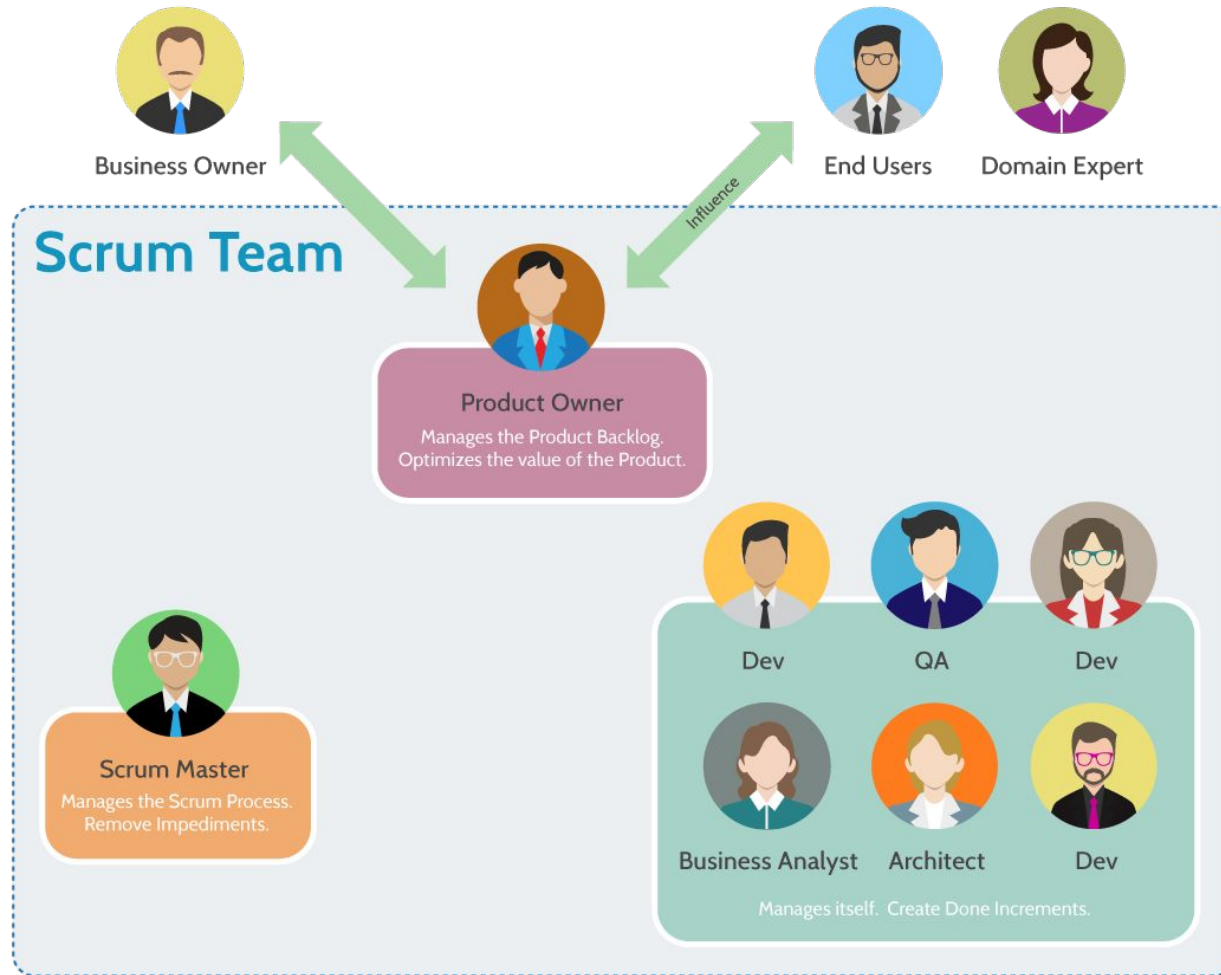

Scrum

Scrum is an agile project management framework that teams use to develop, deliver, and sustain complex products. Scrum is about continuously shipping value to customers. It's a **framework for getting work done**.

Scrum **helps teams start thinking in a more agile way** and practice building agile principles into work communication and team work.

With Scrum, a **product is built in a series of iterations** called sprints. They break down big, complex projects into bite-sized pieces.

Kanban

Kanban is a popular framework used to implement agile and DevOps software development. It requires real-time communication of capacity and full transparency of work.

Work items are represented visually on a kanban board, allowing team members to see the states of every piece of work at any time.

In agile development, work in progress (WIP) limits set the maximum amount of work that can exist in each status of a workflow. Limiting the amount of work in progress makes it easier to identify inefficiency in a team's workflow.
